```

Since scheme_name column has 28166 unkowns, nearly 50% unknown values we are dropping it.

```
joined_pandas_df = joined_data_df.toPandas()  
  
region_status_group_counts = joined_pandas_df.groupby(['region', 'status_group']).size().unstack()  
  
# Create a stacked bar chart  
fig = px.bar(region_status_group_counts, x=region_status_group_counts.index,  
             y=['functional', 'non functional', 'functional needs repair'],  
             title='Distribution of Water Point Status Group by Region',  
             barmode='stack')  
fig.show()
```

Distribution of Water Point Status Group by Region

Above graph explains the regions level of maintainance of the water points.

```
# Group by 'payment' and 'status_group' and get counts
basin_status_group_counts = joined_pandas_df.groupby(['payment', 'status_group']).size().reset_index(name='count')

# Create a grouped bar chart
fig = go.Figure()

for status_group in basin_status_group_counts['status_group'].unique():
    status_group_data = basin_status_group_counts[basin_status_group_counts['status_group'] == status_group]
    fig.add_trace(go.Bar(x=status_group_data['payment'], y=status_group_data['count'], name=status_group))

fig.update_layout(title='Distribution of Water Point Status Group by Payment',
                  xaxis_title='Payment',
                  yaxis_title='Count',
                  barmode='group')
fig.show()
```

Here we can see that majority of the never pay payment group have non functional pumps

```
# Create a Sunburst chart
# Group by 'source' and 'status_group' and get counts
basin_status_group_counts = joined_pandas_df.groupby(['source', 'status_group']).size().reset_index(name='count')
fig = px.sunburst(basin_status_group_counts, path=['source', 'status_group'], values='count',
                  title='Distribution of Water Point Status Group by Source')
fig.show()
```

Distribution of Water Point Status Group by Source

We can observe that majority of the waterpoints are installed on shallow wells, springs, machine_dbhs and rivers

```
# Create a heatmap
basin_status_group_counts = joined_pandas_df.groupby(['extraction_type_class', 'status_group']).size().reset_index(name='count')
basin_status_group_pivot = basin_status_group_counts.pivot(index='extraction_type_class', columns='status_group', values='count')
fig = go.Figure(data=go.Heatmap(
    z=basin_status_group_pivot.values,
    x=basin_status_group_pivot.columns,
    y=basin_status_group_pivot.index,
    colorscale='Viridis'
))

fig.update_layout(title='Distribution of Water Point Status Group by Extraction type class',
                  xaxis_title='Status Group',
                  yaxis_title='Extraction Type Class')
fig.show()
```

Distribution of Water Point Status Group by Extraction type class

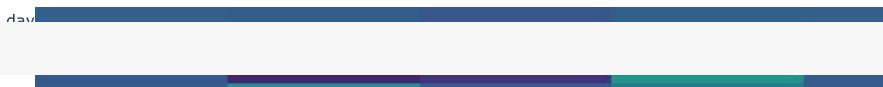

We can observe that majority of the waterpoints are gravity based while wind-powered was the least

```

▼ Task15: Define the SparkML Pipelines for the preprocessing stages as below.

▼ i. Combine all the numerical columns as vector (VectorAssembler for numerical columns)

```
dtypes = train_df.dtypes  
numerical_attrs = [item[0] for item in dtypes if item[1].startswith('double') or item[1].startswith('int')]  
numerical_attrs  
  
['amount_tsh',  
 'gps_height',  
 'longitude',  
 'latitude',  
 'num_private',  
 'region_code',  
 'district_code',  
 'population',  
 'year',  
 'month',  
 'day']  
  
# Vector assembler on numerical attributes  
vectorAssembler_numVars = VectorAssembler(inputCols=numerical_attrs , outputCol="num_features_all")
```

ii. Standardize the values in the above vector using StandardScaler available in pyspark.ml.feature

```
standardScalar_NumVars = StandardScaler(inputCol="num_features_all",outputCol="scaled_num_features")
```

▼ iii. StringIndexer and OneHotEncoderEstimator for the categorical columns.

```
catAttrs = [item[0] for item in dtypes if item[1].startswith('string')]  
catAttrs
```

```
['funder',  
 'installer',  
 'wpt_name',
